1     **DISCUSSING ALCOHOL IN MEDICINES USE REVIEWS: EXPERIENCES**  
2             **OF PATIENTS IN A COMMUNITY PHARMACY CONTEXT**

3     **Abstract**

4     *Objectives*

5     Although pharmacist-led medicines use reviews (MURs) are effective for medicines  
6     management, little is understood about patients' experiences of alcohol-related advice  
7     delivered therein. Sampling a population at high-risk for misuse (within an area of  
8     socioeconomic deprivation), we explored patient experiences of alcohol-related  
9     MURs.

10

11    *Methods*

12    Two focus groups were conducted with patients who had discussed alcohol in an  
13    MUR in the preceding three months (n = 9). Data were analysed thematically.

14

15    *Key findings and conclusion*

16    Patients were open to discussing alcohol in the MUR context. The absence of  
17    practitioner-patient power asymmetry, and pharmacists' sensitivity to cultural  
18    contexts, were critical to patient engagement.

19    Key words: Alcohol use, medicine use review, healthy lifestyle, community pharmacy

20

## 1 INTRODUCTION

2 Alcohol misuse is a public health priority. UK guidelines recommend regular  
3 opportunistic intervention from practitioners<sup>1</sup>. Pharmacist-led medicines use reviews  
4 (MURs) present one such opportunity, yet patient perceptions of alcohol-related  
5 advice within this setting are unclear.

6 Work that considers patients' experiences of pharmacy-based public health  
7 services tends to use quantitative methodologies rather than deep engagement with  
8 patient experiences.<sup>2,3</sup> Moreover, limited attention has been paid to the needs of  
9 communities who are more challenging to recruit to interventions and achieve poorer  
10 outcomes despite high need and pharmacy accessibility.<sup>4</sup> In socioeconomically  
11 deprived areas, alcohol consumption generally exceeds recommended guidelines and  
12 alcohol-related ill health is disproportionately likely<sup>5</sup>. In these areas, there is likely to  
13 be a greater power asymmetry between healthcare practitioners and patients that may  
14 lead to sub-optimal advice-seeking<sup>6</sup>.

15 The present study collected descriptive qualitative data about alcohol-related  
16 MUR discussions from patients in an area of high deprivation. The objectives were to:  
17 (i) explore patients' experiences of alcohol-related discussions within MURs; and  
18 (ii) understand the particular experiences of patients from socioeconomically deprived  
19 areas vis-a-vis pharmacy-based alcohol-related discussions.

20

## 1 METHODS

### 2 Context

3 The study, which was conducted as a final year MPharm project, took place in  
4 Middlesbrough, North-East England, where 48.8% of neighbourhoods are among the  
5 10% of most deprived in the UK<sup>7</sup>. Participants were recruited through an independent  
6 community pharmacy which has two pharmacists, six support staff and counter  
7 assistants; is a level 2 Healthy Living Pharmacy; and is attached to a therapy centre  
8 offering massages and reflexology. All research team members are independent from  
9 the pharmacy. Ethics approval was given by Durham University's School of  
10 Medicine, Pharmacy and Health Ethics Committee  
11 (Reference:PESC\_Proj2016\_22\_WhittleseaCM).

12

### 13 Participants

14 8 males and 1 female, aged 63-77, were purposively sampled after having discussed  
15 alcohol consumption in an MUR within the preceding three months. All had one or  
16 more chronic conditions (Table 1). Individual-level socio-economic information was  
17 not collected; all lived within the selected area of interest for the study..

18 [Insert Table 1 about here]

19

### 20 Data Collection and Analysis

21 Two focus groups were held in November/December 2016. Focus group 1 had  
22 four participants and focus group 2 had five. Each lasted approximately one hour  
23 and was audio-recorded. Focus groups were facilitated by a semi-structured topic  
24 guide covering; (i) study information, (ii) perceptions of MURs, (iii) participants'  
25 recent MUR consultation, (iv) discussing alcohol within the MUR, and (v)

- 1 summary. Following verbatim anonymised transcription by AP, the data were
- 2 analysed thematically using Barbour's<sup>8</sup> five stage approach.
- 3

## 1 RESULTS

### 2 **1: Openness to discussing alcohol**

3 Participants did not see alcohol consumption as a sensitive subject to discuss,  
4 recognising such discussions as providing supportive advice. Willingness to engage  
5 was associated with a personalised and caring approach by the pharmacist:

6 *“he [the pharmacist] is so open... He’s very concerned about you” (P1, FG1)*

7 *“You feel you’re being dealt with personally... which is absolutely excellent”*

8 *(P4, FG2)*

9

### 10 **2: Assisting understanding**

11 Participants reported finding official guidelines “*extremely confusing*” given  
12 information relating to alcohol changed regularly:

13 *“I think, one of the big problems... the NHS, doctors have, whatever, is... I*

14 *believe a lack of confidence in statements that saying... so many units is- over*

15 *so many units bad for you because it’s changed over the years” (P9, FG2)*

16 MURs were recognized as “*very informative*” for making sense of this information.

17 Participants were receptive to discussions about interactions between medication and  
18 alcohol, but still expressed some lack of trust in the quality of this information:

19 *“If [the pharmacist] actually said to me, right, this medication – really, you*

20 *should not drink any alcohol, I would feel comfortable in saying to him, why?*

21 *Can we talk about it? And I’m not gonna say or promise I believe him, but I*

22 *would listen to him, and I would make a judgment” (P9, FG2)*

23

### 24 **3: Cultural drinking norms**

1 Participants used the MUR to reflect on wider social and contextual influences on  
2 their alcohol use. Occupational settings and norms were recognised as facilitators of  
3 alcohol consumption:

4 *“we go to lots of company functions... We’re staying in a hotel, and*  
5 *everybody’ll be drinking” (P5, FG2)*

6 *“getting ready for a shift change-over, and they’d have a tray ready with.. a*  
7 *dozen half-pints, ready pulled” (P7, FG2)*

8

9 Within these social spaces, participants reporting failing to monitor drinking or were  
10 dishonest when it was discussed. Given this, participants recognized the benefits of  
11 pharmacy-based MURs as providing a safe space for discussing alcohol,  
12 acknowledging the sensitivity of the pharmacist regarding this:

13 *“it’s more, amenable to talk here, about it because I- I can be honest and*  
14 *don’t feel, that people are going to be judgmental” (P9, FG2)*

15

#### 16 **4: Benefits of pharmacy-based interventions**

17

18 Participants highlighted community pharmacy accessibility and pharmacist  
19 approachability as beneficial. This was contrasted with experiences of other  
20 healthcare practitioners (namely GPs) where participants perceived a power  
21 imbalance:

22 *“And they [GPs] quite pointedly tell you, well, I’ve.. ten minutes.. and you*  
23 *feel rushed, and there’s something else you’d like to ask, but you’ve got to*  
24 *go...” (P8, FG2)*

25 *“Maybe it’s just me, but I find my GP’s more judgemental” (P8, FG2)*

26 *“strict and overpowering I find, the doctor” (P5, FG2)*

27

## 1 DISCUSSION

2 In summary, the study found that patients perceive community pharmacies as  
3 appropriate and supportive environments for alcohol-specific advice if approached in  
4 a non-judgmental way. Pharmacists were seen as key practitioners for helping  
5 patients to navigate the complex, and sometimes contradictory, informational  
6 landscape.

7 There are limitations of the study: (i) the sample was relatively small and  
8 homogenous; (ii) data were from one site; and (iii) we did not specifically recruit  
9 socio-economically deprived participants. However, the study provides a strong  
10 foundation for future research on alcohol-focused conversations in community  
11 pharmacy settings.

12 United Kingdom guidelines recommend regular and opportunistic intervention when  
13 patients are in contact with practitioners. Brief interventions (i.e., a single  
14 conversation/session) have demonstrated small but clinically meaningful effects on  
15 alcohol use for adults, especially when delivered in primary care settings.<sup>9</sup>

16 The present findings demonstrate that MURs represent appropriate and acceptable  
17 encounters in which to open such conversations. The article highlights benefits of  
18 community pharmacies for providing alcohol-related advice. Community pharmacists  
19 have been identified as the first port of call for patients for health advice. Such  
20 accessibility is particularly pertinent in areas of high deprivation where pharmacists  
21 are accessible<sup>5</sup> and where the power asymmetry between doctors and patients might  
22 be most keenly felt<sup>6</sup>.

23 The findings show that patterns of alcohol consumption are culturally-located and  
24 sometimes endemic in working practices. Therefore, interventions need to be  
25 appropriately positioned,<sup>10</sup> with advice making sense within patients' cultural

1 contexts. Future research should work *with* deprived communities to develop  
2 culturally-meaningful information resources, conveyed *through* respected channels  
3 and *within* pertinent environments. A larger scale exploration of patient experience  
4 across a variety of delivery sites may give more nuanced understanding.

5

## 6 CONCLUSIONS

7 Community pharmacy MURs were perceived by participants as useful and  
8 appropriate for alcohol-related discussion. This may be particularly the case for  
9 individuals from deprived areas contending with drinking cultures linked to social and  
10 working lives, alongside a wariness of more medicalized settings. Pharmacists are  
11 well-placed to bridge the gap between guidelines and daily experiences of clients, and  
12 discuss the place of alcohol in patients' lives.
